

Infinite Scroll and Submitting a Form with AJAX & JQuery

In this project you'll get a chance to set up a front end for an existing API on the internet called the Open Movie Database (OMDB)(modeled after IMDB). Read through the OMDB documentation before getting started so you have an idea of how you might submit a new movie entry.

Create an infinite-scrolling page of movies from the Open Movie Database. The user should look for a title previously, and your web must show the results.

1. You should use the tools that have been teaching in our classes, like git, yeoman, etc..
2. The User Interface will be marked too.
3. You're going to grab a whole bunch of movies and display them, but since the API will potentially return a really large number of movies, you should only display a few at a time. Make an AJAX call to the database to retrieve and display 10 movies on your page.
4. Create an infinite scroll that loads another 10 movies and adds them to the bottom every time you scroll down to the bottom of the page. Your "loading..." icon should come into play here too while waiting for the next batch of movies to be added.
5. Push your solution to Github
